

## EXECUTIVE Q&A PREPARATION GUIDE

Subject: Anticipated Board Questions & System Architecture

### 1. How does the AI actually predict the next month's sales?

Answer: The system uses a Machine Learning model called Polynomial Regression. It analyzes historical trends and curves in our past data to mathematically forecast where the sales are heading next month.

### 2. Where does the AI get the 'Reasons for Downfall/Growth'?

Answer: The engine looks at Growth Momentum (month-over-month changes) and Volatility (fluctuations). If it sees momentum dropping while volatility is high, it flags a structural risk.

### 3. How accurate is this prediction?

Answer: In the PDF's Executive Summary, you'll see a metric called 'Model Accuracy (R-squared)'. The closer that number is to 1.0, the more confident we can be in the prediction.

### 4. What happens if we want to look at a completely different dataset?

Answer: The dashboard is dynamic. Just click 'Upload Custom CSV', upload the new data, and the AI will instantly retrain itself and generate a brand-new PDF report.

### 5. How is the PDF generated? Did you just use a template?

Answer: No, the PDF is generated programmatically from scratch in real-time. Every time you click the download button, the code dynamically draws the letterhead and builds the tables based on the data.

### 6. Is this data secure? Where is it being stored?

Answer: The system runs completely locally on our infrastructure. The data is never sent to external third-party servers. It is highly secure and isolated.

### 7. How can we improve the accuracy even further?

Answer: If we start uploading richer datasets that include external factors (like marketing spend or seasonal weather), we can upgrade the AI to an XGBoost model for near-perfect accuracy.

### 8. Why is the prediction lower/higher than I expected?

Answer: The AI is purely objective and data-driven. It mathematically calculates the momentum of the last few months. If sales have been trending slightly downward, it will project that downward curve.
